- The rated loads are determined according to EN13000 rating with the machine on firm level ground.
- The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
- Be sure to attach the hanger sheaves block to the top boom when boom length is 15m and 18m.
- Be sure to remove the hanger sheaves block from the top boom when boom length is 21m or more.
- To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.
- Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.
- The counter weight is 65.4ton. (Superstructure 56.4ton + Undercarriage 9.0 ton)
- Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

1. The rated loads are determined according to EN13000 rating with the machine on firm level ground.
2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

| Hook Capacity (t) | Hook Weight (t) |
|-------------------|-----------------|
| 150 | 2.59 |
| 120 | 2.35 |
| 80 | 1.35 |
| 35 | 0.90 |
| 12 | 0.51 |

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.
5. The offset angles shown are of jib boom offset angle against the main boom, under load.
6. The counter weight is 65.4ton. (Superstructure 56.4ton + Undercarriage 9.0 ton)

1. The rated loads determined according to EN13000 rating with the machine on firm level ground.
2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.
4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.
5. The offset angles shown are of jib boom offset angle against the main boom, under load.
6. The counter weight is 65.4 ton. (Superstructure 56.4ton + Undercarriage 9.0 ton)
7. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

1. The rated loads are determined according to EN13000 rating with the machine on firm level ground.
2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
3. Be sure to attach the hanger sheaves block to the top boom when boom length is 15m and 18m.
4. Be sure to remove the hanger sheaves block from the top boom when boom length is 21m or more.
5. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.
6. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.
7. The counter weight is 65.4ton. (Superstructure 56.4ton + Undercarriage 9.0 ton)
8. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.
